SOLAR AND RENEWABLE ENERGY

PAXON

# Field discipline built for solar.

Vegetation management, construction inspection, and program management for operators who need site-aware field execution, not a generic program applied regardless of field reality.

WHAT MAKES SOLAR SITES DIFFERENT

# Solar sites require a site-aware approach

Generic field programs often fall short at solar facilities. These conditions drive the need for experienced, site-specific execution.

### Wet and saturated conditions

Standing water and saturated low points between panel rows require daily access evaluation and track-capable or site-appropriate equipment, so work stays safe and assets stay undamaged.

### Constrained panel row access

Cross bars and panel spacing limit equipment size and turning radius. Match equipment to row configuration: zero-turn mowers where access is tight, larger equipment where it is not.

### Pre-existing damage liability

A pre-job visual inspection documents the condition of panels and site assets, protecting operator and contractor from ambiguous damage claims.

### Coordination and site controls

Defined work windows, access protocols, and environmental controls shape every visit. Programs are built around them, not in spite of them.

HOW WE HELP

# Services for renewable energy operators

## Solar vegetation management

Cycle-based mechanical and chemical vegetation programs tailored to solar site configurations, including constrained panel rows, wet ground, and defined treatment buffers.

## Construction and inspection management

Independent construction oversight and quality assurance during build-out, helping keep civil, electrical, and structural work on schedule and built to spec.

## PMO services

Program management support for solar capital projects: schedule control, cost visibility, contractor coordination, and stakeholder reporting across complex builds.

WHAT WE DELIVER

# Capabilities for solar and renewable operations

## Vegetation programs

- Mechanical control: zero-turn, brush hog, and string trimmer programs
- Non-selective herbicide at perimeter, drive areas, and pads
- Track-capable equipment for saturated or low-bearing-capacity ground
- Fence-line buffer management inside and outside perimeter
- Planned multi-cycle programs, quarterly or custom cadence

## Asset protection and safety

- Pre-job visual panel inspection and damage documentation
- Field safety planning and required PPE compliance
- Weather and access condition evaluation before each cycle
- Cycle closeout reporting and deferred area documentation

## Construction and program management

- Construction QA/QC and independent inspection oversight
- Capital project scheduling, cost control, and contractor management
- Site coordination and stakeholder communication programs

WHY PAXON

# Field discipline built for solar

01

## Site-specific, not generic

Equipment selection, access planning, and field controls matched to the site, not carried over from utility ROW work.

02

## Field-proven execution

Direct experience managing vegetation at large-scale solar facilities with difficult ground, tight rows, and complex coordination.

03

## Asset protection built in

Pre-job inspections, defined work limits, and immediate damage notification reduce liability exposure for operators.

04

## Cycle programs that hold

Quarterly or custom-cadence programs built around your access windows and growth patterns, not a standard interval.

05

## Safety-first in every deployment

Required PPE, site-specific safety planning, weather and ground assessment before entry, and a defined damage reporting chain.

06

## Supports the full lifecycle

From construction through operations: inspection management, program oversight, and field execution.

PAXON

SUPPORTING YOUR SOLAR PROGRAM

# Let’s talk about your site.

Our team is ready to discuss your site conditions, operating requirements, and program needs, and develop a tailored approach that works for your facility.
